## What is in helita?

---

Helita has the following packages:

- **io**: read/write files of different formats
- **obs**: a few modules to work with solar observations (mostly Hinode and IRIS)
- **sim**: modules to read/write and interact with input/output from simulations and radiative transfer codes
- **utils**: miscellaneous utilities, mostly mathematical modules such as curve fitting, interpolation, signal processing
- **vis**: visualisation modules, mostly working only in Jupyter.
